

File: titan.zip ringtones

www.yeralan.org, April 2, 2012

University of Southampton Centre for Ultrasonic and Underwater Acoustics published virtual sounds of methane falls on Saturn's moon Titan. Researchers use physical properties such as density, gas composition, temperature, etc. to predict how things would sound in different environments. Also published is the sound of a splashdown of a spacecraft onto Titan's methane sea. The virtual sounds are available from the University of Southampton website. I converted these sounds to MPEG-4 Audio suitable to be used as ringtones. Please note that the extensions m4r are used by iPhone. You may rename the extension for other phones. If you want to load these ringtones on iPhone, first add the ringtones to your iTunes library and then load the ringtones to your phone.
